

Classical field models for condensates of light

Michiel Wouters

Theory of Quantum and Complex Systems, Universiteit Antwerpen, Belgium
michiel.wouters@uantwerpen.be

In this lecture, I will discuss the modelling of nonequilibrium condensation in photonic systems, including polariton and photon condensation with a generalized noisy Gross-Pitaevskii equation. Various versions of the model will be discussed as well as the basic properties of their solutions, including quantized vortices.
